

**LISTING OF CLAIMS**

1. (Previously Presented) A motorcycle comprising:
  - a frame having a head tube;
  - a steering fork having a pair of fork tubes;
  - a lower triple clamp and an upper triple clamp rotatably coupled to the head tube and operatively coupled to the pair of fork tubes such that the steering fork rotates relative to the frame;
  - a fastener assembly adapted to rotatably couple the head tube to the upper and lower triple clamps;
  - one or more riser tubes each having an upper surface and a lower surface, the lower surface of each riser tube operatively coupled to the upper triple clamp and the upper surface of each riser tube operatively coupled to a riser cap, the riser tube and the riser cap coupled together by at least two fasteners visible only from an underside of the riser tube, each riser tube including a base end and an extension end, each base end extending in a first direction, the first direction being at an angle from vertical, the extension end extending in a second direction outward from the base end of each riser tube; and
  - a handlebar having a portion thereof located between each riser tube and riser cap.
2. (Previously Presented) The motorcycle of claim 1, wherein each of the fasteners comprises a threaded bolt.
3. (Original) The motorcycle of claim 1, wherein the upper surface of each riser tube has one or more bores.
4. (Original) The motorcycle of claim 3, wherein a lower surface of the riser cap comprises one or more bosses having inner threading.

**Application Serial No. 10/725,356**  
**Amendment Dated October 5, 2006**  
**Reply to Final Office Action of July 14, 2006**

5. (Original) The motorcycle of claim 4, wherein each bore is adapted to align with one of the threaded bosses on the lower surface of the riser cap.
6. (Original) The motorcycle of claim 5, wherein each fastener is adapted to extend through one of the bores and to be received by one of the bosses.
7. (Previously Presented) The motorcycle of claim 1, wherein the handlebar is free from direct contact with the fasteners.
8. (Original) The motorcycle of claim 1, wherein the upper end of each of the one or more riser tubes comprises a first recess.
9. (Previously Amended) The motorcycle of claim 8, wherein a lower surface of each of the one or more riser caps comprises a second recess.
10. (Original) The motorcycle of claim 9, wherein a cavity sized to accommodate and secure the handlebar is comprised from the combination of the first and second recesses when each of the one or more riser tubes and the one or more riser caps is coupled.
11. (Original) The motorcycle of claim 10, wherein each of the first and second recesses define an equal portion of the cavity.
12. (Previously Amended) A handlebar mounting assembly comprising:  
one or more riser tubes each having an upper surface, each of the riser tubes having a first recess defined in the upper surface and one or more bores extending through the upper surface, the first recess dimensioned to conform to a first portion of an exterior surface of the handlebar, each riser tube including a base end and an extension end, each base end extending in a first direction, the first direction being at an angle from vertical, the extension end extending in a second direction outward from the base end of each riser tube;  
one or more riser caps each having a lower surface and a smooth upper surface, each of the riser caps having a second recess defined in the lower surface and one or more bosses

**Application Serial No. 10/725,356  
Amendment Dated October 5, 2006  
Reply to Final Office Action of July 14, 2006**

located in the lower surface, the second recess dimensioned to conform to a second portion of the exterior surface of the handlebar; and

at least two fasteners extending through the one or more bores of the one or more riser tubes into the one or more bosses of the one or more riser caps, the fasteners securing the one or more riser caps to the one or more riser tubes and adapted to accommodate and secure an external surface portion of the handlebar between the one or more riser tubes and the one or more riser caps.

13. (Original) The assembly of claim 12, wherein each of the first and second recesses define an equal portion of a cavity that accommodates the handlebar.

Claims 14-17 Cancelled.

18. (Previously Presented) The motorcycle of claim 1, wherein one or more of the first direction and the second direction comprise a rearward direction with respect to the motorcycle.

19. (Previously Presented) The motorcycle of claim 1, wherein the first direction is generally upward.

20. (Previously Presented) The motorcycle of claim 1, wherein the second direction is generally horizontal.

21. (Previously Presented) The motorcycle of claim 1, wherein the fasteners of each riser tube are aligned along a vertical plane centered within each riser tube, the vertical plane running front to back through each riser tube.
